

Responsive @container

The same `.card` component, unmodified, in three containers of different widths on one page. Each stacks or goes horizontal purely from its own container's width crossing `@container` (min-width: 400px) - not the page's.

```
container-type: inline-size;  
width: 220px
```

Stacked

Narrower than 400px, so the card stays a column.

```
container-type: inline-size; width: 500px
```

Horizontal

500px crosses the 400px breakpoint, so the same rule flips this card to a row.

```
container-type: inline-size; width: 320px
```

Stacked

320px is still under 400px, so this one stays stacked too - despite being on the exact same page as the 500px one above.
