CSS `font-variant-alternates` & `@font-feature-values`

`@font-feature-values` gives a font's numbered stylistic-set features (`ss01`–`ss20`, `cv01`–`cv99`, and the single-feature `salt`, `swsh`, `ornm` and `nalt`) a readable name per font family, so `font-variant-alternates` can select them by name instead of a raw index. Recursive's `ss01` swaps a double-story lowercase "a" for a simplified single-story form, and its `ss02` does the same for "g" - both real GSUB Single Substitution data, confirmed by direct byte inspection, not an approximation.

```
@font-feature-values Recursive {
  @styleset { simple-a: 1; simple-g: 2; }
}
```

styleset(): named aliases for ss01/ss02

Same text, same font - only `font-variant-alternates` differs:

font-variant-alternates	Sample
normal (default forms)	agog gala
styleset(simple-a)	agog gala
styleset(simple-g)	agog gala
styleset(simple-a, simple-g)	agog gala
