

# Hyphenation control properties (CSS Text 4)

The first two pairs of columns are the same long words; hyphenate-character swaps the glyph and hyphenate-limit-chars moves the break point by widening the before/after minimums. The middle pair is running prose, where hyphenate-limit-zone accepts a larger ragged gap rather than hyphenating the line's last word. The last pair repeats one long word, where hyphenate-limit-lines caps how many consecutive lines may end in a hyphen.

|                                                                                                                                                                                                                            |                                                                                                                                                                                                     |                                                                                                                                                                                      |                                                                                                                                                                                                                          |                                                                                                                                                                                                                                |
