

CSS list-style-type Value Coverage

1 — Symbolic markers (disclosure- open/-closed) and a literal <string> marker

disclosure-open/disclosure-closed are fixed, uncounted glyphs (every item gets the same marker); a <string> value is literal marker text with no automatic suffix.

• Item one • Item two • Item three disclosure- open list-style-type: disclosure-open;	▸ Item one ▸ Item two ▸ Item three disclosure- closed list-style-type: disclosure-closed;	→ Item one → Item two → Item three literal <string> list-style-type: '→ ';	- Item one - Item two - Item three none (baseline) list-style-type: none;
---	---	--	---

2 — Fixed styles, past their range

ckj-earthly-branch/ckj-heavenly-stem have a finite 12/10-symbol range; a counter value beyond it falls back to plain decimal, per CSS Counter Styles Level 3.

⌚. Item one ⌚. Item two ⌚. Item three ckj-earthly- branch (1-12) list-style-type: ckj-earthly-branch;	⌚. Item one ⌚. Item two ⌚. Item three ckj-heavenly- stem (1-10) list-style-type: ckj-heavenly-stem;	⌚. Item one ⌚. Item two ⌚. Item three ckj-decimal list-style-type: ckj-decimal;	፩. Item one ፪. Item two ፫. Item three ethiopic- numeric list-style-type: ethiopic-numeric;
---	---	---	--

3 — Hebrew: additive numbering, including the 15/16 override

15 and 16 are manually overridden to טו/טז instead of the naive combination, which closely resembles the Tetragrammaton - list starts at item 14 to show the transition, and now correctly reaches four digits (1000+) rather than silently dropping the thousands place.

יט Item
טז Item
טז Item
יז Item
יח Item
יט Item

list-style-type: hebrew; <ol start="14">

4 — Additional numeric/alphabetic/fixed styles now supported

Every value below is verified by the automated test suite (CommonUtilsTests/ListItemCounterIntegrationTests) against the CSS Counter Styles Level 3 spec text. Rendering the actual script glyph (rather than this page's fallback font's notdef box) needs a font covering that script registered via PdfGenerator.AddFontFromStream - see docs/usage-examples.md#fonts - the same requirement any HTML renderer has for non-Latin text.
